VORLD BANK GROUP

Introduction to the World Bank Group and GFDRR

World Bank Group (WBG)

- "Twin goals": end extreme poverty and promote shared prosperity.
- Source of financial and technical assistance to developing countries.

Global Facility for Disaster Reduction and Recovery (GFDRR)

- Partnership (WBG, UN and countries) to integrate disaster risk management (DRM) and climate change adaptation into development.
- Knowledge, technical assistance and financing hub for DRM within the WBG.

GFDRR Hydromet

- WBG focal point and service center to mobilize resources, guide and support large investments in hydrometeorlogical modernization:
 - Capacity building and analytical support. ullet
 - Portfolio development and investment support. \bullet
 - Development partners' coordination. lacksquare

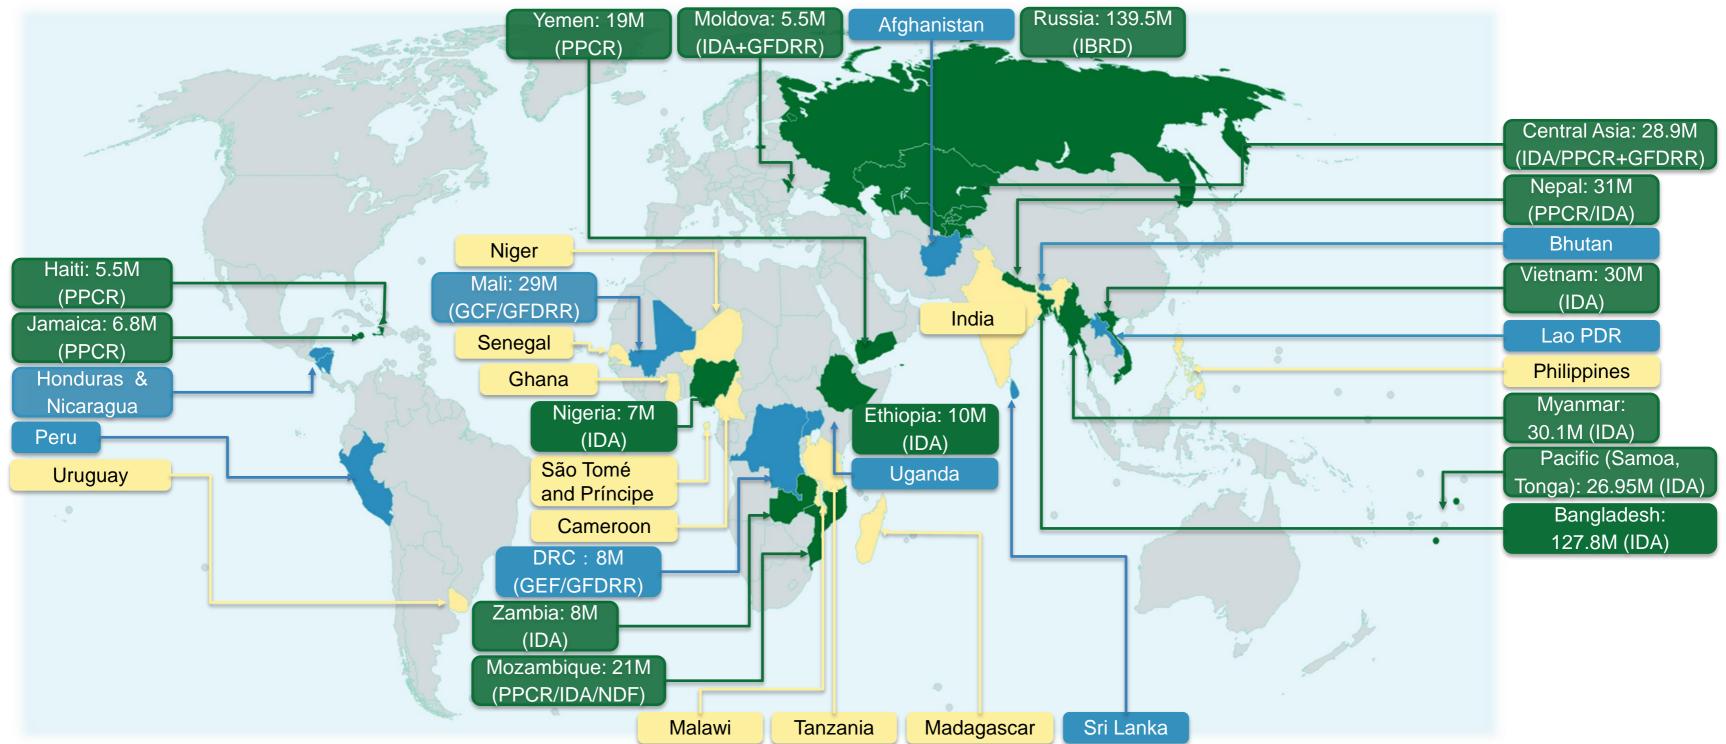

WBG portfolio overview: selected hydromet projects

WBG projects under implementation WBG projects in preparation **GFDRR** technical assistance only

WORLD BANK GROUP

Triple dividends of resilience

Г		1	
	 1st Dividend of Resilience: Avoided losses Increasd resilience reduces disaster losses by: 1. Saving lives 2. Reducing infrastructure damages 3. Reducing economic losses 	Benef disast	
	 2nd Dividend of Resilience: Development Increased resilience unlocks suppressed economic potential and stimulates economic activity by: 1. Encouraging housholds to save and build assets 2. Promoting entrepreneurship 3. Stimulating firms to invest and innovate. 	Benef Regar	
1	3rd Dividend of Resilience: Co-benefits Beyond increasing resilience, DRM projects also yield positive economic, social and environmental side-effects (co-benefits).	disast

Adverse weather impacts poverty

- The impact of extreme weather on poverty is more devastating than previously understood, responsible for annual losses of \$520 billion and pushing 26 million people into poverty every year.
- Targeted resilience-building interventions protect poor people from adverse weather events and can help countries and communities save \$100 billion a year.

Outcomes

VALUE Benefits & costs

Benefits of access to global NWP for low income countries

- Based on data and information from ECMWF, DWD (Germany), Météo France, Met Office (UK) & Met Service (NZ)
- Utilizes approach/assumptions from Hallegatte (2012), which concluded that if hydrometeorological services globally were at the same level as those in high income countries:
 - Additional 23,000 lives saved per year.
 - Up to \$2 billion in additional asset losses avoided per year.
 - Up to \$30 billion in additional economic production per year.
- Major assumptions (among many!):
 - Regional and national capacity to fully utilize NWP products.
 - 15%-35% of hydromet service improvements attributed to better NWP access.
- Analysis for 31 low income countries indicates improved access to NWP could yield benefits of up to \$500 million per year (scaled-up including lower middle income countries: benefits > \$7 billion/year).
- Over 80 times greater than the costs of delivering/customizing NWP for low income countries.

Selected lessons from hydromet modernization projects

- Modernization of NMHSs is a high value investment delivering a broad range of socioeconomic benefits.
- Building infrastructure is less challenging than building institutions, strengthening capacity and sustaining them.
- Prioritize public services open data approach is best.
- Leverage international and regional systems and partners.
- Weigh innovation verses reliability, scale and sustainability.
- Increasing demand for full access to global NWP.

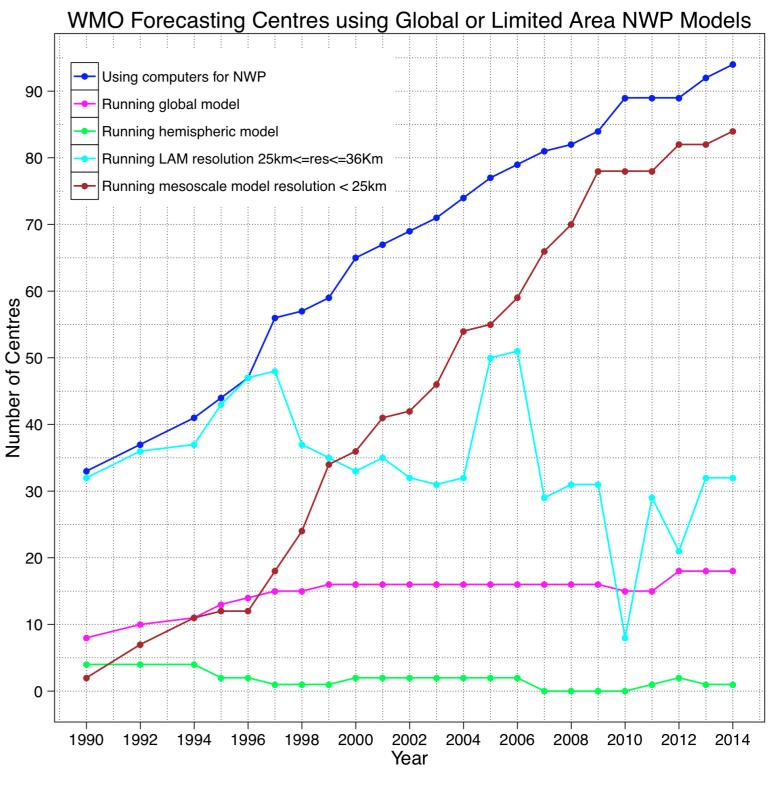

RI D BANK GROUP

NWP demand from developing countries

- Quantifying the impact of severe weather is much more important than characterizing the weather.
- For example, hydrological and hydraulic models need to be driven by high resolution NWP (preferably ensembles) to inform better decisions on likely impacts and response.
- The need for higher resolution local area models and linked hydrological models will increase, putting more demand on access to the best available global mesoscale ensemble products.
- Simply making all digital data freely available is not what is required; it needs to be properly curated to ensure reliability and usability.

/ORLD BANK GROUP

More usage = more value generated

The more NWP is used to inform decisions, the more value it will generate.

Conclusions

- Global NWP has the potential to additionally generate tens of billions of US\$ in socioeconomic benefits per year in developing countries.
- To fully realize these potential benefits, real-time access to numerical products as digital information (rather than images) is needed, accompanied by training support.
- Simply making all digital data freely available is not sufficient; it needs to be properly curated to ensure reliability and usability.
- This generates an incremental cost to NWP producers supplying information to developing countries, such that additional resources to ensure reliability and usability are required.
- Global NWP and its potential benefits for developing countries fulfill the utilitarian principle; it should therefore be treated as a global public good.
- Therefore, to realize the untapped potential of global NWP, equitable international financing solutions should be developed to ensure sufficient accessibility for developing countries.
- However even with unhindered access to the full set of global NWP products, significant investment is needed in regional and national forecasting, early warning, capacity building, and preparedness capacities to fully leverage NWP products.
