l'Environnement*

GEMS DoW for GHG-WP4

- Task 4.1: enhanced inversion procedure
 - Adaptation of existing inversion scheme to satellite data from AIRS
 - New version of the inversion scheme
 - First inversion performed and evaluated
- Task 4.2: sensitivity of the inversion to transport parameterizations
 - New evaluation of LMDZ and of its adjoint
 - First evaluation of the sensitivity of the inversion to transport parameterizations
- Task 4.3: development of a routine processing chain in NRT
- Task 4.4: inversion of fluxes over the 2003-2007 period

Developing the inversion scheme

- Flux inversions tend to process observations at increasing temporal resolution, to solve fluxes at increasing spatial and temporal resolutions
 - Exploit individual measurements
 - Resolve grid point fluxes
- Computational challenge
 - Not possible with standard approach based on a suite of matrix operations

A new variational system

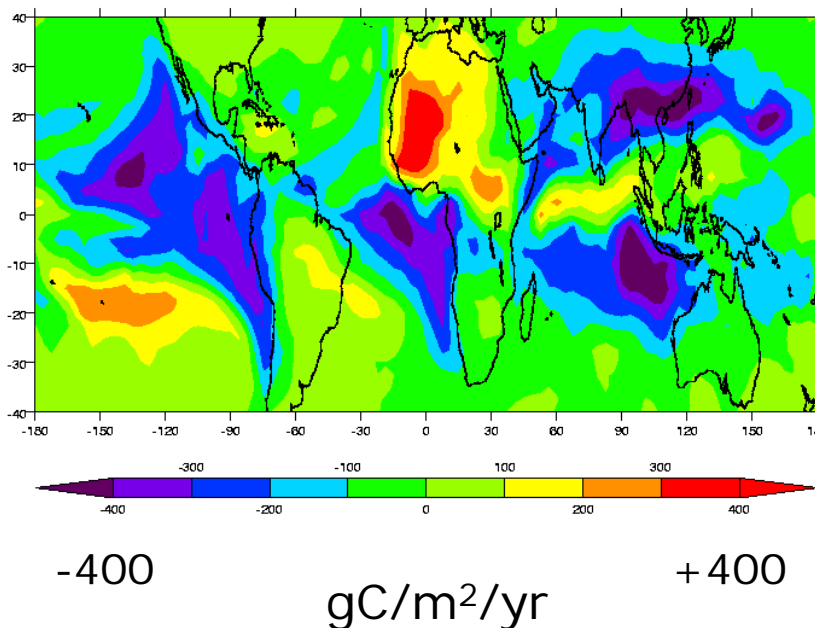

- Implement ECMWF 4D-Var science at LSCE
 - New inversion system
 - $1\text{it}/1\text{yr}/1\text{x}64\text{bit}@2.4\text{GHz}$ = 7 hours CPU
- Two minimization algorithms to deal with non-linearities
 - Inner loop/ outer loop system with conjugate gradient (ECMWF)
 - M1QN3 (INRIA)
 - Translated in Python
- Tangent-linear and adjoint models of LMDZ tracer transport
 - Existing retro-transport approach not accurate enough
 - Exact TL and AD coded

- Chevallier et al., *J. Geophys. Res.*, 2005

Application to TOVS

- Upper-tropospheric CO₂ from Chédin et al (2003)
 - 347,400 observations at LMDZ resolution
 - 200,000 variables to optimize

Analysis – Prior
June 1990

Application to AIRS

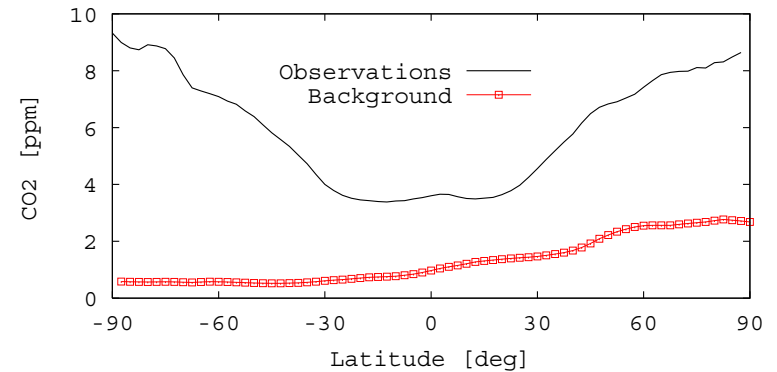

Observations: upper-tropospheric CO₂ from Engelen et al (2004)
Background: climatological fluxes + LMDZ

Chevallier et al., *Geophys. Res. Lett.*, 2005
Tiwari et al., *J. Geophys. Res.*, 2006

Comparing the variability

- Standard deviations of the fields by latitude band
- Obs-BG departure RMS

Scale from 0 to 9 ppm

Chevallier et al., *Geophys. Res. Lett.*, 2005

Analysis fit to GLOBALVIEW stations

- Regular flux inversion from AIRS

AN better than FG
AN worse than FG

- Flux inversion with 2.5ppm-biased climatology

Application to OCO

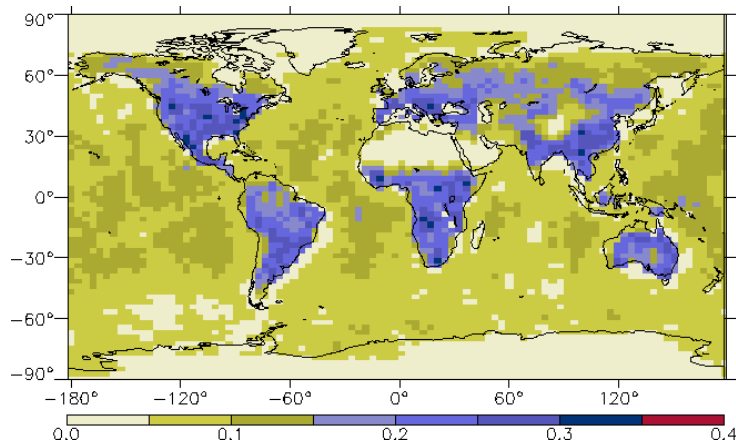

- Error statistics in inversion problem fully consistent with simulation world
 - Sanity check of the inversion scheme
 - Investigate number of iterations
- Cost function at minimum should be about the number of observations (244,000)
- We get $J \sim 255,000$ at the 55th iterations
- One outer loop update is enough to care about the non-linearities of the transport numerics

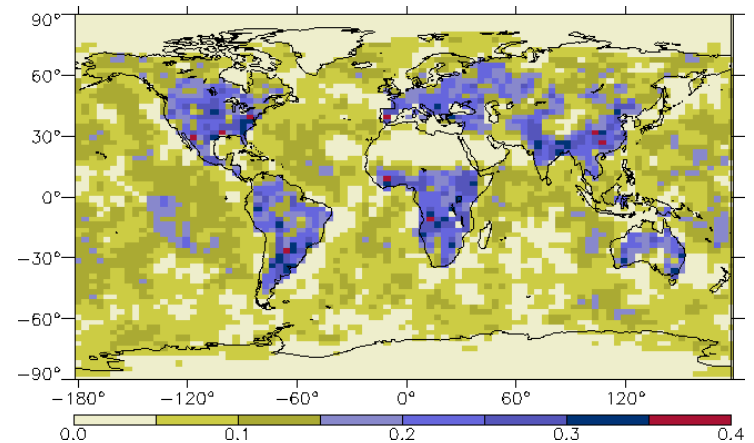

Chevallier et al., *in prep.*, 2006a

Application to OCO

- Error statistics in inversion problem fully consistent with simulation world
 - Get extra diagnostics
 - DFS > 9500 for one year
 - Error reduction

Weekly CO₂ fluxes

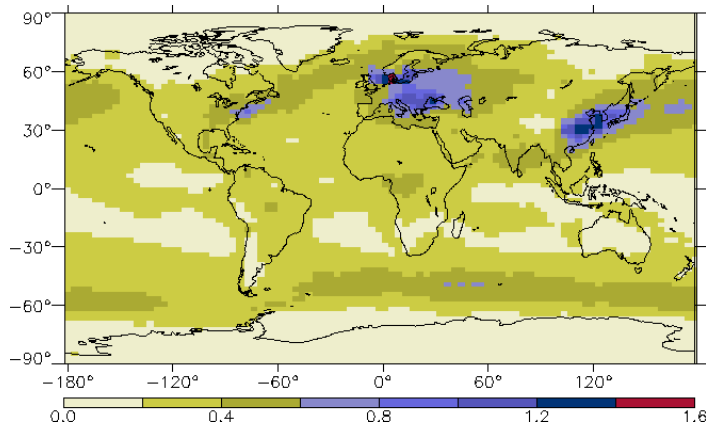

Monthly CO₂ fluxes

Application to OCO

- Error statistics in inversion problem fully consistent with simulation world
 - Investigate impact of biases

Annual-mean of the bias introduced (ppm)

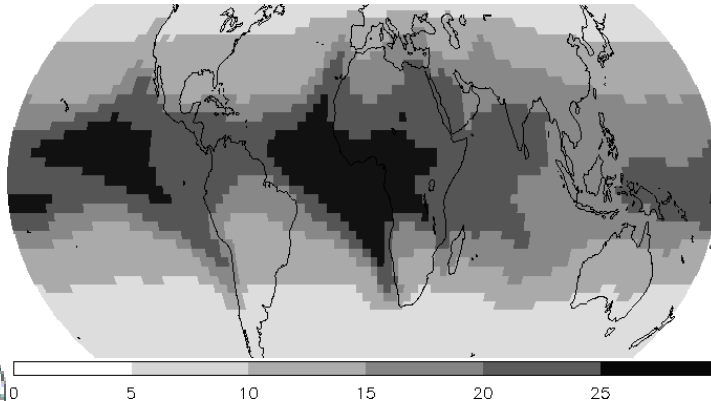

Impact in terms of bias in large regions (ppm)

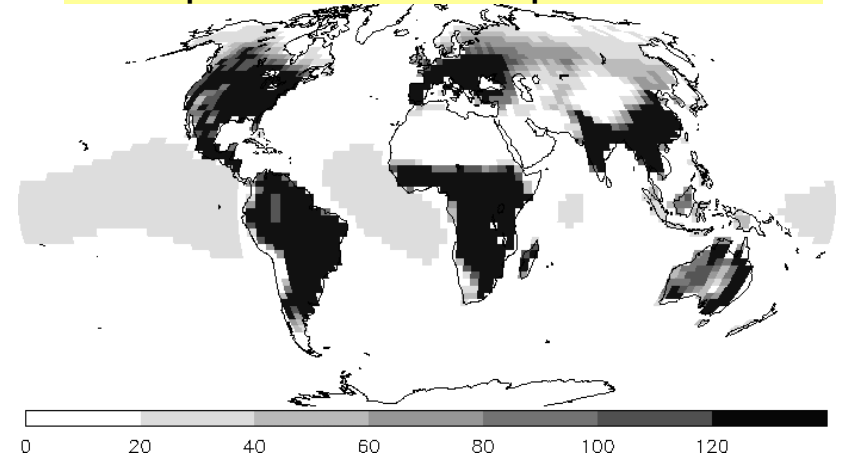

Impact of prior information

- Prior information modelled as multivariate Gaussian probability distribution
 - Error variances, spatiotemporal correlations

Theoretical error reduction
Uniform prior errors

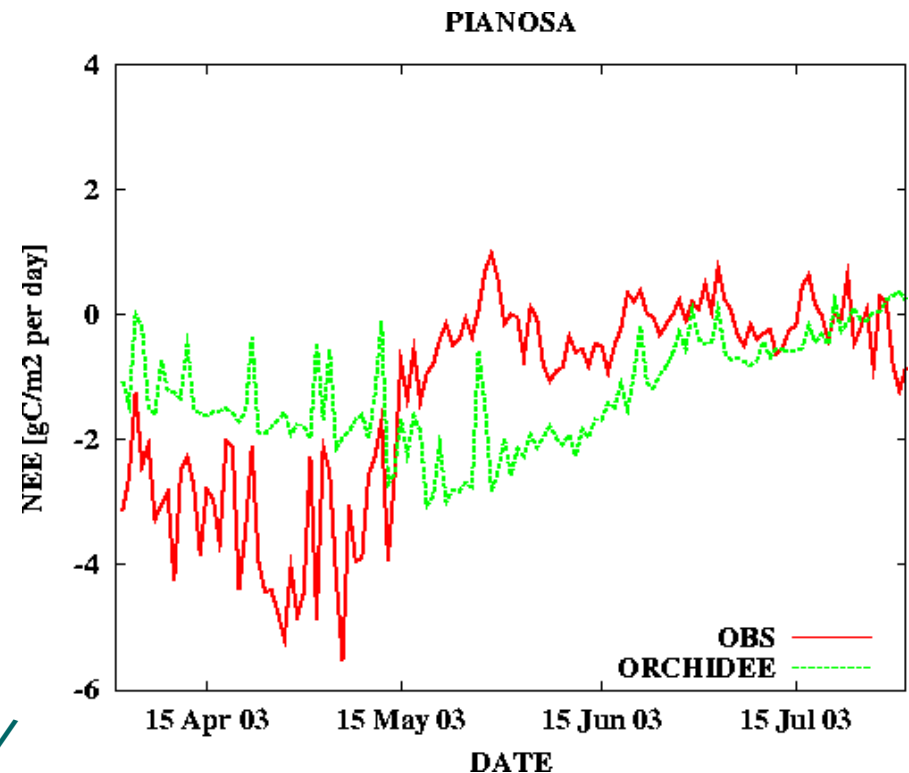

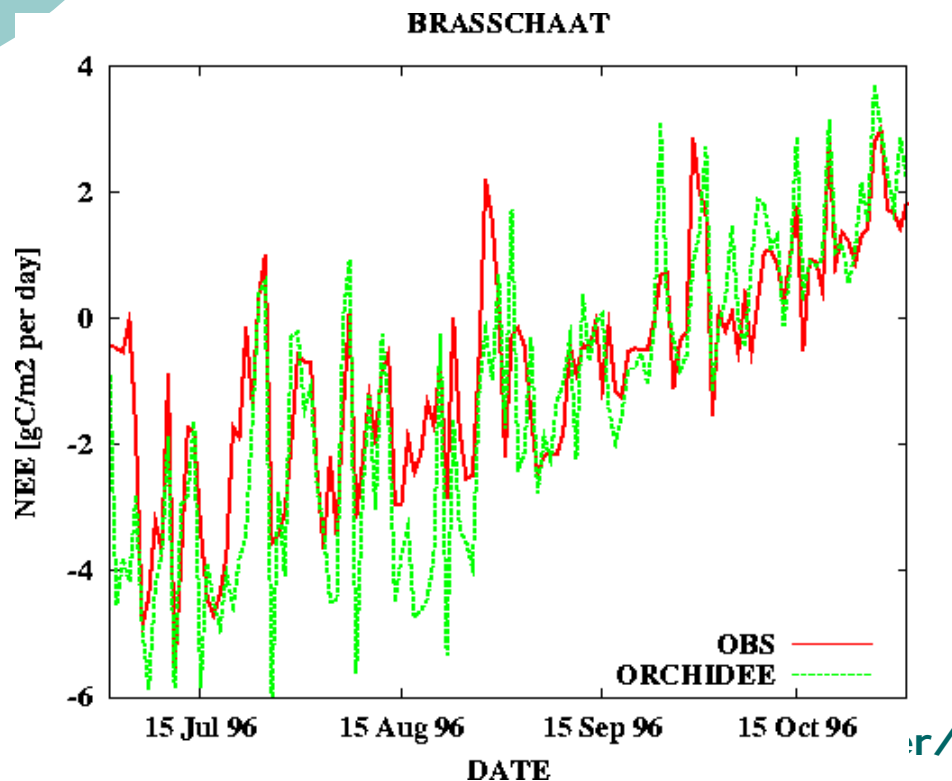

Theoretical error reduction
Biosphere-related prior errors

Chevallier et al., *J. Geophys. Res.*, 2005

Validation of ORCHIDEE

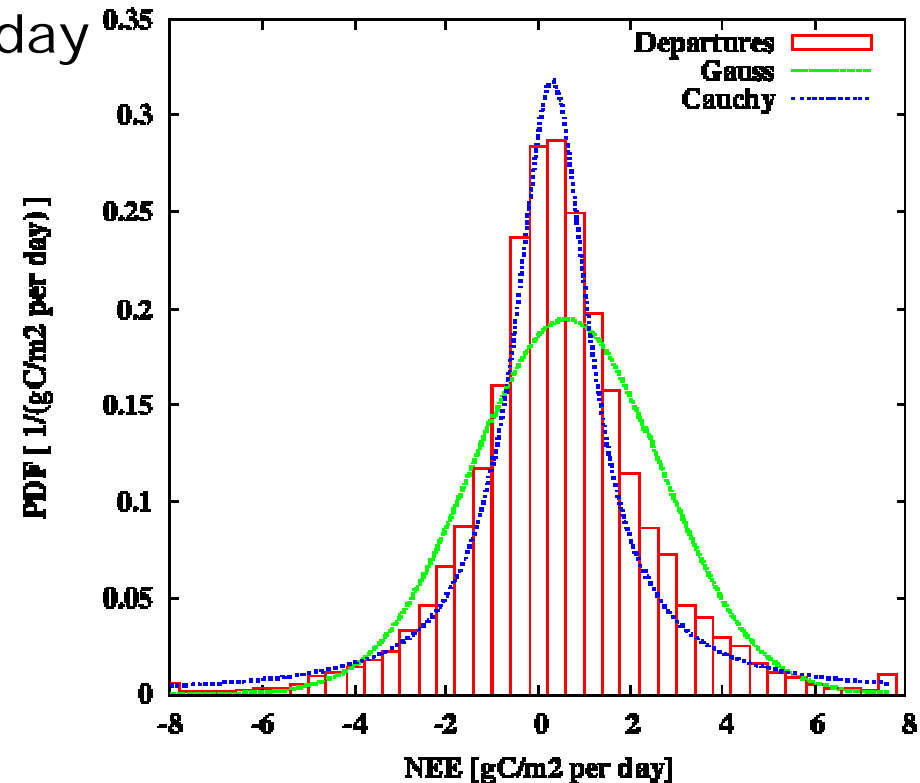

- 36 in situ FLUXNET sites between 1994 and 2004
- 31,500 daily-mean fluxes
- Link with FP6 GEOLAND

Validation of ORCHIDEE

- 36 in situ FLUXNET sites between 1994 and 2004
- 31,500 daily-mean fluxes
- Std error = 2 gC/m²/day

PDF of the
model-minus-observations
departures
+ 2 standard distributions

Validation of ORCHIDEE

- 36 in situ FLUXNET sites between 1994 and 2004
- 31,500 daily-mean fluxes
- Std error = 2 gC/m²/day

Overall
error time
correlations

Validation of ORCHIDEE

- 36 in situ FLUXNET sites between 1994 and 2004
- 31,500 daily-mean fluxes
- Std error = 2 gC/m²/day

Error space
correlations
for each site

Validation of ORCHIDEE

- Convenient approximation of prior errors as multivariate Gaussian distributions is not legitimate in flux inversions
 - ... at least when using daily fluxes from ORCHIDEE
 - Flux error distribution closer to a Cauchy distribution
 - No particular spatial error structure
 - Time dependency of the correlation rather linear after lag-day 2

Chevallier et al., *in prep.*, 2006b

GEMS DoW for GHG-WP4

- Task 4.1: enhanced inversion procedure
 - Adaptation of existing inversion scheme to satellite data from AIRS
 - New version of the inversion scheme
 - First inversion performed and evaluated
- Task 4.2: sensitivity of the inversion to transport parameterizations
 - New evaluation of LMDZ and of its adjoint
 - First evaluation of the sensitivity of the inversion to transport parameterizations
- Task 4.3: development of a routine processing chain in NRT
- Task 4.4: inversion of fluxes over the 2003-2007 period

Plus...

- Evaluation of the usefulness of OCO
- Investigation of prior errors
- 2 papers published
- 2 papers in preparation

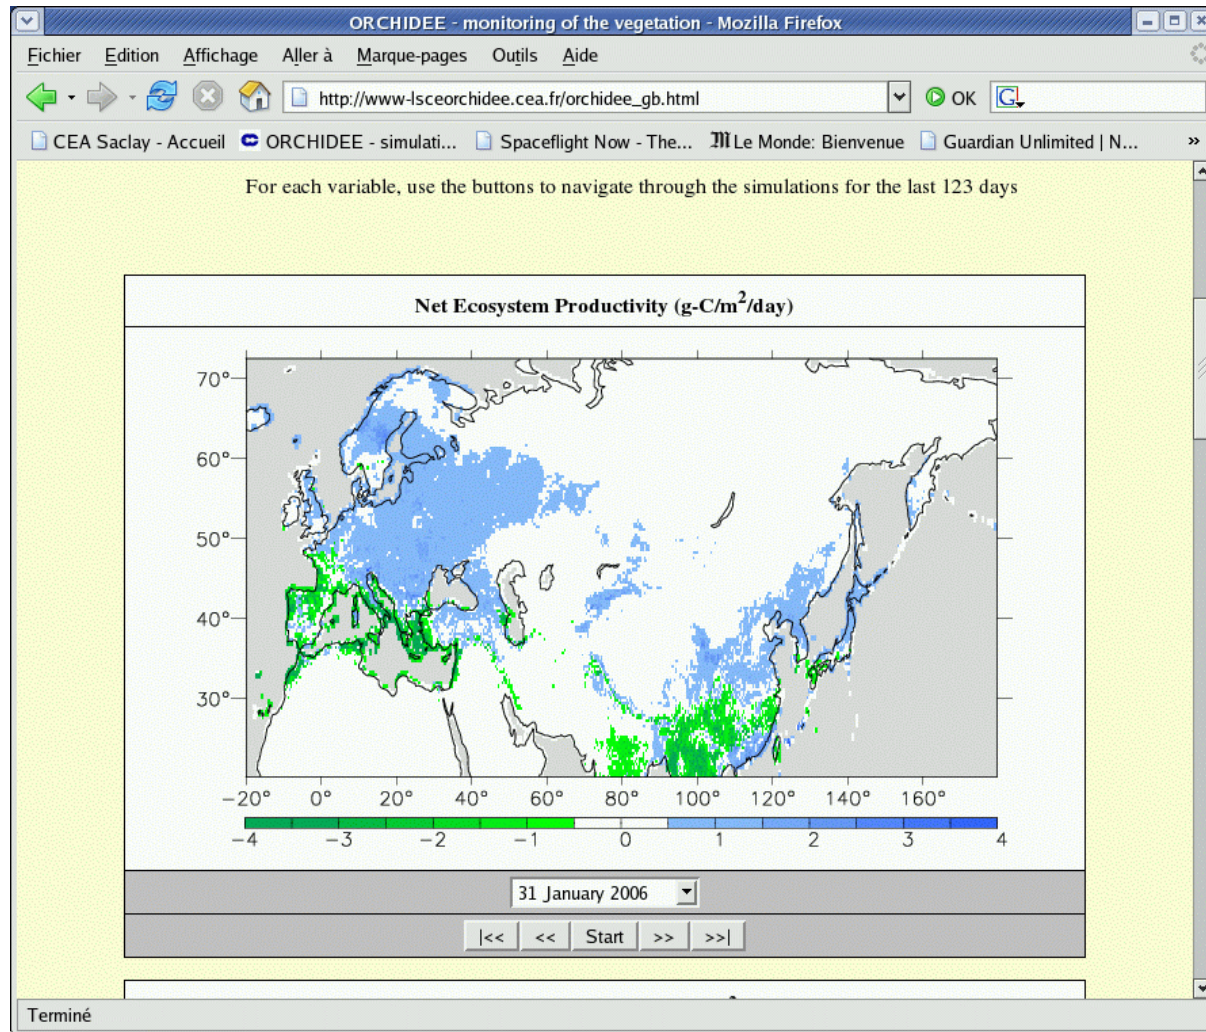

DoW M13-30

- Task 4.1: enhanced inversion procedure
 - New version of the inversion scheme
 - Investigate prior error
 - New inversions of AIRS performed and evaluated
 - Study IASI retrievals
- Task 4.2: sensitivity of the inversion to transport parameterizations
 - New evaluation of LMDZ
 - First evaluation of the sensitivity of the inversion to transport parameterizations
- Task 4.3: development of a routine processing chain in NRT
 - Set-up LMDZ part
- Task 4.4: inversion of fluxes over the 2003-2007 period
