Application and verification of ECMWF products in Turkey 2008

Turkish State Meteorological Service, Ankara / Turkey

1. Summary of major highlights

2. Use and Application of Products

2.1.1 Statistical Adaptation

Kalman Filtering

Kalman Filtering is applied to 101 stations including 31 foreign stations from D+1 to D+4 for 2-meter maximum and minimum temperatures.

2.1.2 Physical Adaptation

MM5

MM5 is run operationally 4 times per day for 48 hours using the boundary and initial conditions from ECMWF BC-Suite Project. MSL pressure, sea surface temperature, and upper level temperature, height, u-v wind components and relative humidity parameters are used as initial conditions for MM5.

METU-3 Wave Model

METU-3 is a wind-wave prediction model developed at Coastal and Harbor Engineering Research Center of Middle East Technical University. METU-3 is operationally running at TSMS for marine forecast for Mediterranean, Marmara, Caspian and Black Sea. METU-3 is running 2 times per day for 72 hours integration using 10 meter u-v wind components of ECMWF deterministic model outputs as initial conditions. METU Wave model outputs are significant wave height and directions, mean wave periods and interpolated 10 meter wind speed and directions.

3. Verification of Products

3.1 Objective Verification

3.1.1 Direct ECMWF Model Outputs

24 hourly forecast periods between T+00 and T+144 of 12 UTC and 00 UTC deterministic model run are operationally verified with standard statistical scores (mean error, root mean square error and mean absolute error). For the verification of all parameters, 60 Turkish synoptic stations were used, covering the period from January to December 2007.

(i) In the free atmosphere

For the verification process of pressure level parameters, observations from 7 radio-sonde stations were used. ECMWF analysis values were referenced for rest of stations.

(ii) Local weather parameters

Interpolated model outputs of local weather parameters (maximum, minimum and 12 UTC of 2 meter temperature, mean sea level pressure, and total precipitation) verified against corresponding observations. For this process, suitable time steps of model outputs were used. Verified parameters and its periods for the year 2007 are given in below:

- Daily Maximum and Minimum Temperature; D+1, D+2, ..., D+6; Scores: ME, RMSE, MAE.
- Mean Sea Level Pressure and 2 m Temperature : D+1, D+2, ..., D+6; Scores: ME, RMSE, MAE.
- Total Precipitation existence and contingency tables with 6 categories (0, 0.1-1, 1-5, 5-10,10-20, 20<mm): D+1, D+2, D+3;
 Secret: BLAS, HIT, FAB, TS, BOD, FKSS, ETS, HSS, OB, OBSS

Scores: BIAS, HIT, FAR, TS, POD,F,KSS,ETS,HSS,OR,ORSS

• 1000, 850, 700, 500 and 300 hPa Height and Temperature: D+1, D+2, ..., D+6 ; Scores: ME, RMSE, MAE.

3.1.2 ECMWF model output compared to other NWP models

We perform verification for MSL pressure, 2m temperature, 10 meter u-v wind components and total precipitation parameters of MM5 model (12 UTC run). However, no objective scores of comparison have been computed between ECMWF and MM5 model. In the subjective verification, 2m temperature values of ECMWF give more accurate result than those of MM5. Whereas, MM5 model forecasts for the total precipitation are better than ECMWF.

3.1.3 Post-processed products

Kalman Filtering

Kalman Filtering applied to 101 stations including 31 foreign stations from D+1 to D+5 for 2-meter maximum and minimum temperatures. Generally, Kalman Filtering outputs are %5-20 better then direct model outputs.

KALMAN 2m.MIN.TEMP RMSE VALUES for D+2

3.1.4 End Products delivered to users

3.2 Subjective verification

3.2.1 Subjective scores

Our Weather Analysis and Forecasting Division (WAFD) uses ECMWF outputs for wide range of purposes from short-range forecasts to the special reports. We compared ECMWF forecasts and those of WAFD forecasts (based on bench forecasters' experience) with observed values. The verification results were based on the observed values received from 60 stations throughout Turkey and ECMWF's D+1, D+2, D+3 and D+4 corresponding forecasts. When "yes-no" type of verification applied for ECMWF precipitation forecasts, little improvements were noted. Most of the figures show a continuing upward trend over the past few years. Based on ECMWF's upward trend, with combining their experiences and ECMWF model outputs, WAFD made better precipitation forecasts than previous years.

3.2.2 Synoptic Studies

None
