1. Introduction

This document describes the ERA-Interim Archive at ECMWF. ERA-Interim is a reanalysis of the global atmosphere covering the data-rich period since 1989, and continuing in real time. As ERA-Interim continues forward in time, updates of the Archive will take place on a monthly basis.

The ERA-Interim project was initiated in 2006 to provide a bridge between ECMWF's previous reanalysis, ERA-40 (1957-2002), and the next-generation extended reanalysis envisaged at ECMWF. The main objectives of the project were to improve on certain key aspects of ERA-40, such as the representation of the hydrological cycle, the quality of the stratospheric circulation, and the handling of biases and changes in the observing system. These objectives have been largely achieved as a result of a combination of factors, including many model improvements, the use of 4-dimensional variational analysis, a revised humidity analysis, the use of variational bias correction for satellite data, and other improvements in data handling.

The ERA-Interim atmospheric model and reanalysis system uses cycle 31r2 of ECMWF's Integrated Forecast System (IFS), which was introduced operationally in September 2006, configured for the following spatial resolution:

- 60 levels in the vertical, with the top level at 0.1 hPa;
- T255 spherical-harmonic representation for the basic dynamical fields;
- a reduced Gaussian grid with approximately uniform 79 km spacing for surface and other grid-point fields.

The atmospheric model is coupled to an ocean-wave model resolving 30 wave frequencies and 24 wave directions at the nodes of its reduced 1.0°x1.0° latitude/longitude grid.

Documentation of the IFS is published on the ECMWF website at <http://www.ecmwf.int/research>. The main characteristics of the ERA-Interim system and many aspects of its performance are described in ECMWF Newsletters 110, 115, and 119; see <http://www.ecmwf.int/publications/newsletters>. With some exceptions, ERA-Interim uses input observations prepared for ERA-40 prior to 2002, and for ECMWF's operational forecast system thereafter. A comprehensive documentation of ERA-Interim, including observation usage, is currently in preparation and will be made available at <http://www.ecmwf.int/research/era>.

Archived ERA-Interim products described in this document comprise:

- analysis and forecast fields from the assimilating atmospheric model at full resolution¹;
- analysis and forecast fields from the atmospheric model evaluated on standard pressure levels;
- analysis fields from the atmospheric model evaluated on isentropic and PV = ± 2 PVU surfaces;
- analysis and forecast fields from the coupled ocean-wave model at full resolution;
- various monthly means for these fields.

Details of the way basic fields are post-processed to produce the archived fields are given in the IFS documentation. Reference should be made in particular to Appendix D: FULL-POS user guide, of Part VI: *Technical and computational procedures*.

¹ These data are model level and surface and single level fields

2. Analysis and forecast fields

2.1. Product generation

The ERA-Interim data assimilation and forecast suite produces:

- four analyses per day, at 00, 06, 12 and 18 UTC;
- two 10-day forecasts per day, initialized from analyses at 00 and 12 UTC.

The analysis produced at 00 UTC on a given day involves observations taken between 15 UTC on the previous day and 03 UTC on the present day; the analysis at 12 UTC involves observations between 03 UTC and 15 UTC.

Unless specified otherwise, forecast data on pressure levels (levtype=pl in MARS) and for the surface and single level parameters (levtype=sfc) are archived at the 28 ranges, or steps, of 3-, 6-, 9-, 12-, 15-, 18-, 21-, 24-, 30-, 36-, 42-, 48-, 60-, 72-, 84-, 96-, 108-, 120-, 132-, 144-, 156-, 168-, 180-, 192-, 204-, 216-, 228-, and 240-hours from daily forecasts at 00 and 12 UTC. Forecast model level data (levtype=ml) are archived at 3-, 6-, 9-, and 12-hour ranges from 00 and 12 UTC. Forecast data is not available for fields on isentropic (levtype=pt) and PV = ± 2 PVU (levtype=pv) levels. On the ECMWF Data Server forecasts are only available for surface and single level fields and only up to a range of 12-hours.

Fields from the atmospheric model are archived either at the full T255 spectral resolution or on the corresponding N128 reduced Gaussian grid, depending on their basic representation in the model. Fields from the coupled ocean-wave model are saved on its reduced 1.0°x1.0° latitude/longitude grid.

The N128 reduced Gaussian grid is symmetric about the equator, with a north-south separation which is close to uniform in latitude, with a spacing of about 0.703125°. There are 128 points aligned along the Greenwich Meridian from equator to pole. The number of points in the east-west varies with latitude, with uniform grid spacing along a particular line of latitude. This spacing is 0.703125° in most of the tropics. The grid is specified (for the Northern Hemisphere) in Table 1, which gives the latitude values (accurate to two decimal points) and the corresponding number of points in the east-west direction. Similar information, for several reduced Gaussian grids commonly used at the ECMWF, is available at <http://www.ecmwf.int/publications/manuals/libraries/interpolation/gaussianGridsFIS.html>.

The WMO format FM92 GRIB is used to represent all analysis and forecast fields. In general, ERA GRIB data are coded using ECMWF's local versions of GRIB code table 2 (version number 128 for atmospheric products, 140 for wave products), which gives parameter names and units. An additional local version, 162, is used for atmospheric parameters that are not included in the standard table version 128. These include the "Additional fields accumulated from the physical parametrizations" in section 2.6. All local ECMWF versions of GRIB code table 2 are tabulated in <http://www.ecmwf.int/services/archive>.

Table 1: The N128 Gaussian grid

| Row no. | Lat. | Points | Row no. | Lat. | Points | Row no. | Lat. | Points | Row no. | Lat. | Points |
|---------|-------|--------|---------|-------|--------|---------|-------|--------|---------|-------|--------|

| 125 | 2.46 | 512 | 126 | 1.75 | 512 | 127 | 1.05 | 512 | 128 | 0.35 | 512 |

2.2. Upper air parameters on model and pressure levels

Upper air data are saved on each of the 60 “full” model levels and on 37 pressure levels, except where stated otherwise. Model “half-level” pressures, $p_{k-1/2}$, are defined by

$$p_{k-1/2} = A_{k-1/2} + B_{k-1/2}p_s$$

where p_s is surface pressure and $k=1,2,3,\dots,61$. The pressures of the “full” model levels, p_k , are defined by

$$p_k = \frac{1}{2}(p_{k-1/2} + p_{k+1/2})$$

Precise values for $A_{k-1/2}$ and $B_{k-1/2}$ should be read from Section 2, the Grid Description Section, of a GRIB file for model-level data. Values accurate to five significant figures are given in Table 2, together with half and full level pressures assuming a surface pressure of 1013.25 hPa. The corresponding heights, z_k , of the full levels are also shown, using a uniform scale height of 7 km for pressure. For this scale height the model level spacing is precisely 1.5 km in the middle stratosphere. The 37 pressure levels to which the model-level fields are interpolated are also indicated in Table 2.

Table 2: Model and pressure levels

| k | Model levels | | | | | Pressure levels (hPa) |
|-----|------------------|-------------|-------------------|-------------|------------|-----------------------|
| | $A_{k-1/2}$ (hP) | $B_{k-1/2}$ | $p_{k-1/2}$ (hPa) | p_k (hPa) | z_k (km) | |

Table 3 gives details of the “upper air” parameters on model and pressure levels. These include surface geopotential and the logarithm of surface pressure. Although not strictly upper air parameters, these are produced in spherical-harmonic form along with the model level data. Surface pressure is needed to compute the distribution of pressure on the model surfaces as indicated above. The table indicates which parameters are stored on model levels and which are stored on pressure levels. The two horizontal representations are indicated by **sh** (spherical harmonics) and **gg** (Gaussian grid). Parameters are available both from analyses and forecasts. Except where indicated forecasts are available at the 28 steps to 10 days on pressure levels and 4 steps to 12 hours on model levels. **Code** refers to the parameter reference number in GRIB code table 2, ECMWF local version 128. Note that the horizontal wind- components (**codes** 131/132) are evaluated from the archived vorticity and divergence by the MARS software when requested.

Table 3: Upper Air Parameters on model and pressure levels

| Parameter | Model levels | | Pressure levels | | Code | Units |
|----------------------------------|--------------|----|-----------------|----|------|---|
| | gg | sh | gg | sh | | |
| potential vorticity ¹ | | | X | | 60 | m ² s ⁻¹ K kg ⁻¹ |
| surface geopotential | | X | | | 129 | m ² s ⁻² |
| geopotential | | | | X | 129 | m ² s ⁻² |
| temperature | | X | | X | 130 | K |
| eastward wind component | | | | | 131 | m s ⁻¹ |
| northward wind component | | | | | 132 | m s ⁻¹ |
| specific humidity | X | | X | | 133 | kg/kg |
| vertical velocity | | X | | X | 135 | Pa s ⁻¹ |
| vorticity | | X | | X | 138 | s ⁻¹ |
| log surface pressure (Pa) | | X | | | 152 | |
| divergence | | X | | X | 155 | s ⁻¹ |
| relative humidity | | | | X | 157 | % |
| ozone mass mixing ratio | X | | X | | 203 | kg/kg |
| cloud liquid water content | X | | X | | 246 | kg/kg |
| cloud ice water content | X | | X | | 247 | kg/kg |
| cloud cover | X | | X | | 248 | (0-1) |

¹ Forecasts are only available up to a range of 12-hours

2.3. Upper air parameters on isentropic and $PV = \pm 2$ PVU surfaces

Analysed fields only are interpolated to sixteen isentropic surfaces. The potential temperatures defining these surfaces are specified in Table 4, which also shows corresponding pressures and heights for a hypothetical 250 K dry isothermal atmosphere.

Table 4: Isentropic levels and corresponding pressures and heights

| Θ (K) | P (hPa) | Z (km) |
|------------------|-----------|----------|
| 265 | 815 | 1.5 |
| 275 | 716 | 2.4 |
| 285 | 632 | 3.4 |
| 300 | 528 | 4.7 |
| 315 | 445 | 5.9 |
| 320 ¹ | 427 | 6.2 |
| 330 | 378 | 7.1 |
| 350 | 308 | 8.6 |
| 370 | 254 | 10.0 |
| 395 | 202 | 11.7 |
| 430 | 150 | 13.9 |
| 475 | 106 | 16.4 |
| 530 | 72 | 19.2 |
| 600 | 47 | 22.4 |
| 700 | 27 | 26.4 |
| 850 | 14 | 31.3 |

Table 5 shows the parameters and horizontal representations of the fields archived on the isentropic surfaces.

Table 5: Parameters on isentropic surfaces

| Parameter | gg | sh | Code | Units |
|----------------------------------|----|----|------|---|
| Montgomery potential | | X | 53 | $\text{m}^2 \text{s}^{-2}$ |
| pressure | | X | 54 | Pa |
| potential vorticity ¹ | X | | 60 | $\text{m}^2 \text{s}^{-1} \text{K kg}^{-1}$ |
| eastward wind component | | | 131 | m s^{-1} |
| northward wind component | | | 132 | m s^{-1} |
| specific humidity | X | | 133 | kg/kg |
| vorticity | | X | 138 | s^{-1} |
| divergence | | X | 155 | s^{-1} |
| ozone mass mixing ratio | X | | 203 | kg/kg |

¹ Only PV is archived at 320 K

Montgomery potential is defined as $\phi + c_{pd}\theta(p/p_0)^{\kappa_d}$, where ϕ and p are respectively the geopotential and the pressure of the constant- θ surface, c_{pd} is the specific heat of dry air at constant pressure and $\kappa_d = R_d/c_{pd}$, where R_d is the gas constant of dry air. Note, however, that θ is defined by $\theta = T(p/p_0)^{-\kappa}$ with κ defined for a moist atmosphere: $\kappa = R/c_p$, where $R = R_d(1 + (R_v/R_d - 1)q)$ and $c_p = c_{pd}(1 + (c_{pv}/c_{pd} - 1)q)$, with q the specific humidity, and R_v and c_{pv} respectively the gas constant and specific heat at constant pressure of water vapour. The effect of moisture is also included in the calculation of ϕ , as described in the documentation of the model.

Analysed fields only are also produced on the “PV= ± 2 PVU” surface on which the potential vorticity takes the value +2 PVU (1 PVU=10⁻⁶ m²s⁻¹Kkg⁻¹) in the Northern Hemisphere and -2 PVU in the Southern Hemisphere, provided such a surface can be found searching downwards from the model level close to 96 hPa. Values at this model level are used where the search is unsuccessful.

Table 6 shows the parameters archived on the PV = ± 2 PVU surface. All fields are saved on the model’s Gaussian grid.

Table 6: Parameters on the PV = ± 2 PVU surface

| Parameter | Code | Units |
|--------------------------|------|--------------------------------|
| potential temperature | 3 | K |
| pressure | 54 | Pa |
| geopotential | 129 | m ² s ⁻² |
| eastward wind component | 131 | m s ⁻¹ |
| northward wind component | 132 | m s ⁻¹ |
| specific humidity | 133 | kg/kg |
| ozone mass mixing ratio | 203 | kg/kg |

2.4. Surface and single level parameters

A variety of instantaneous surface and single level parameters are saved on the model's Gaussian grid. The list of these differs according to whether they are produced by the analysis (**An**), or the forecast (**Fc**), and is given in Table 7 below. Except where indicated forecasts are available at the 28 steps to 10 days.

Table 7: Instantaneous surface and single level parameters

| Parameter | An | Fc | Code | Units |
|--|----|----|------|--------------------------------|
| low vegetation cover | X | | 27 | (0-1) |
| high vegetation cover | X | | 28 | (0-1) |
| low vegetation type (table index) | X | | 29 | index |
| high vegetation type (table index) | X | | 30 | index |
| sea ice fraction | X | X | 31 | (0-1) |
| sea surface temperature | X | X | 34 | K |
| snow albedo | X | X | 32 | (0-1) |
| snow density | X | X | 33 | kg |
| sea ice temperature layer 1 | X | X | 35 | K |
| sea ice temperature layer 2 | X | X | 36 | K |
| sea ice temperature layer 3 | X | X | 37 | K |
| sea ice temperature layer 4 | X | X | 38 | K |
| soil moisture level 1 (volumetric) | X | X | 39 | m ³ /m ³ |
| soil moisture level 2 (volumetric) | X | X | 40 | m ³ /m ³ |
| soil moisture level 3 (volumetric) | X | X | 41 | m ³ /m ³ |
| soil moisture level 4 (volumetric) | X | X | 42 | m ³ /m ³ |
| convective available potential energy | | X | 59 | J kg ⁻¹ |
| standard deviation of filtered subgrid orography | X | | 74 | m |
| total column liquid water | | X | 78 | kg m ⁻² |
| total column ice water | | X | 79 | kg m ⁻² |
| surface geopotential | X | X | 129 | m ² s ⁻² |
| surface pressure ¹ | X | X | 134 | Pa |
| total column water | X | X | 136 | kg m ⁻² |
| total column water vapour | X | X | 137 | kg m ⁻² |
| soil temperature level 1 | X | X | 139 | K |
| snow depth | X | X | 141 | m of water equivalent |
| Charnock parameter | X | X | 148 | |
| mean sea level pressure | X | X | 151 | Pa |
| boundary layer height | | X | 159 | m |
| standard deviation of orography | X | | 160 | m |
| anisotropy of orography | X | | 161 | |
| angle of sub-grid scale orography | X | | 162 | |
| slope of sub-grid scale orography | X | | 163 | |
| total cloud cover | X | X | 164 | (0-1) |

¹ Forecasts are only available up to a range of 12-hours

| Parameter | An | Fc | Code | Units |
|---|----|----|------|----------------------|
| 10 metre eastward wind component | X | X | 165 | m s ⁻¹ |
| 10 metre northward wind component | X | X | 166 | m s ⁻¹ |
| 2 metre temperature | X | X | 167 | K |
| 2 metre dewpoint | X | X | 168 | K |
| soil temperature level 2 | X | X | 170 | K |
| land/sea mask | X | X | 172 | (0,1) |
| surface roughness | X | | 173 | m |
| albedo (climate) | X | | 174 | |
| soil temperature level 3 | X | X | 183 | K |
| low cloud cover | X | X | 186 | (0-1) |
| medium cloud cover | X | X | 187 | (0-1) |
| high cloud cover | X | X | 188 | (0-1) |
| skin reservoir content | X | X | 198 | m of water |
| total column ozone | X | X | 206 | kg m ⁻² |
| instantaneous eastward component of turbulent stress | | X | 229 | N m ⁻² |
| instantaneous northward component of turbulent stress | | X | 230 | N m ⁻² |
| instantaneous surface heat flux | | X | 231 | W m ⁻² |
| instantaneous moisture flux (evaporation) | | X | 232 | kg m ⁻² s |
| log. surface roughness length (m) for heat | X | | 234 | |
| skin temperature | X | X | 235 | K |
| soil temperature level 4 | X | X | 236 | K |
| snow temperature | X | X | 238 | K |
| forecast albedo | | X | 243 | |
| forecast surface roughness | | X | 244 | m |
| forecast log. surface roughness length (m) for heat | | X | 245 | |

Table 8 lists the accumulated (from the beginning of the) forecast surface and single level parameters, which are also saved on the model's Gaussian grid.

Table 8: Forecast accumulated surface and single level parameters

| Parameter | Code | Units |
|---|------|-----------------------|
| clear sky surface photosynthetically active radiation | 20 | W m ⁻² s |
| snow evaporation | 44 | m |
| snow melt | 45 | m |
| large-scale precipitation fraction | 50 | s |
| downward UV radiation at the surface | 57 | W m ⁻² s |
| surface photosynthetically active radiation | 58 | W m ⁻² s |
| large-scale precipitation | 142 | m of water |
| convective precipitation | 143 | m of water |
| snowfall | 144 | m of water equivalent |
| boundary layer dissipation | 145 | W m ⁻² s |
| surface sensible heat flux | 146 | W m ⁻² s |
| surface latent heat flux | 147 | W m ⁻² s |

| Parameter | Code | Units |
|--|------|-----------------------|
| downward surface solar radiation | 169 | W m ⁻² s |
| downward surface thermal radiation | 175 | W m ⁻² s |
| surface solar radiation | 176 | W m ⁻² s |
| surface thermal radiation | 177 | W m ⁻² s |
| top solar radiation | 178 | W m ⁻² s |
| top thermal radiation | 179 | W m ⁻² s |
| eastward component of turbulent stress | 180 | N m ⁻² s |
| northward component of turbulent stress | 181 | N m ⁻² s |
| evaporation | 182 | m of water |
| sunshine duration | 189 | s |
| latitudinal component of gravity wave stress | 195 | N m ⁻² s |
| meridional component of gravity wave stress | 196 | N m ⁻² s |
| gravity wave dissipation | 197 | W m ⁻² s |
| runoff | 205 | m of water |
| top solar radiation clear sky | 208 | W m ⁻² s |
| top thermal radiation clear sky | 209 | W m ⁻² s |
| surface solar radiation clear sky | 210 | W m ⁻² s |
| surface thermal radiation clear sky | 211 | W m ⁻² s |
| top incident solar radiation | 212 | W m ⁻² s |
| total precipitation | 228 | m of water |
| convective snowfall | 239 | m of water equivalent |
| large-scale snowfall | 240 | m of water equivalent |

Table 9 lists the forecast minimum/maximum surface and single level parameters, which are also saved on the model's Gaussian grid. These fields contain the minimum or maximum values of the parameter since the previous post-processing.

Table 9: Forecast minimum/maximum surface and single level parameters

| Parameter | Code | Units |
|--|------|-------------------|
| wind gusts at 10 m | 49 | m s ⁻¹ |
| maximum 2m temperature since last post-processing step | 201 | K |
| minimum 2m temperature since last post-processing step | 202 | K |

2.5. Ocean-wave data

A set of ocean-wave products are generated by the wave analysis and coupled wave-model forecasts. The latter are available every 12 hours up to 10 days from 00 and 12 UTC. They are archived together with fields of gridded data from the altimeters on the ERS-1 and ERS-2 satellites. The archived fields are identified in MARS by **stream=wave** and are listed in Table 10. **Code** refers to the parameter reference number in GRIB code table 2, ECMWF local version 140. Data are stored on the wave model's reduced 1.0°x1.0° latitude/longitude grid.

Table 10: Wave Data: Analyses, forecasts and gridded ERS altimeter fields

| Parameter | Code | Units |
|--|------|--|
| model bathymetry ¹ | 219 | m |
| mean wave period from 1st moment | 220 | s |
| mean wave period from 2nd moment | 221 | s |
| wave spectral directional width | 222 | |
| mean wave period from 1st moment of wind waves | 223 | s |
| mean wave period from 2nd moment of wind waves | 224 | s |
| wave spectral directional width of wind waves | 225 | |
| mean wave period from 1st moment of swell | 226 | s |
| mean wave period from 2nd moment of swell | 227 | s |
| wave spectral directional width of swell | 228 | |
| significant wave height | 229 | m |
| mean wave direction | 230 | degrees |
| peak period of 1d spectra | 231 | s |
| mean wave period | 232 | s |
| coefficient of drag with waves ² | 233 | |
| significant height of wind waves | 234 | m |
| mean direction of wind waves | 235 | degrees |
| mean period of wind waves | 236 | s |
| significant height of total swell | 237 | m |
| mean direction of total swell | 238 | degrees |
| mean period of total swell | 239 | s |
| mean square slope of waves | 244 | |
| 10m wind speed modified by wave model ² | 245 | m s ⁻¹ |
| gridded ERS altimeter wave height ^{1,3} | 246 | m |
| gridded corrected ERS altimeter wave height ^{1,3} | 247 | m |
| gridded ERS altimeter range relative correction ^{1,3} | 248 | |
| 2D wave spectra (single) ⁴ | 251 | m ² s radians ⁻¹ |
| wave spectral kurtosis | 252 | |
| Benjamin-Feir index | 253 | |
| wave spectral peakedness | 254 | s ⁻¹ |

¹ Only analysed data is available

² Forecasts are also available at a range of 3-hours

³ Available from late 1991

⁴ Available for 30 frequencies and 24 directions

2.6. Additional fields accumulated from the physical parametrizations

The data described in the following subsections are accumulated from the beginning of the forecasts, initialised at 00 and 12 UTC, over the ranges of 3-, 6-, 9- and 12-hours. **Code** refers to the parameter reference number in GRIB code table 2, ECMWF local version 162. These parameters are saved on the model's Gaussian grid.

2.6.1. Parameters to support chemical-transport modelling

Table 11 lists the fields produced for use in chemical-transport modelling and other trajectory studies. These are archived on model half levels.

Table 11: Parameters to support chemical transport modelling

| Parameter | Code | Units |
|--|------|--------------------|
| updraught mass flux | 104 | kg m ⁻² |
| downdraught mass flux | 105 | kg m ⁻² |
| updraught detrainment rate | 106 | s m ⁻¹ |
| downdraught detrainment rate | 107 | s m ⁻¹ |
| total precipitation profile | 108 | kg m ⁻² |
| turbulent diffusion coefficient for heat | 109 | m ² |

2.6.2. Radiative tendencies

The parameters indicated in Table 12 are tendencies from cloudy and clear-sky radiation, which are saved on full model levels.

Table 12: Parameters to validate clear sky radiation

| Parameter | Code | Units |
|---|------|-------|
| Short wave radiative tendency | 100 | K |
| Long wave radiative tendency | 101 | K |
| Clear sky short wave radiative tendency | 102 | K |
| Clear sky long wave radiative tendency | 103 | K |

2.6.3. Net tendencies from parametrized processes

Net tendencies from parametrized processes are saved on full model levels and listed in Table 13.

Table 13: Net Tendencies

| Parameter | Code | Units |
|------------|------|-------------------|
| u tendency | 112 | m s ⁻¹ |
| v tendency | 113 | m s ⁻¹ |
| T tendency | 110 | K |
| q tendency | 111 | kg/kg |

3. Monthly means

A variety of monthly means of many of the analysis and forecast fields described in section 2 are computed and archived during the ERA-Interim production. Monthly means of the analysis fields are produced for surface and single level parameters and for parameters on model levels, pressure levels, the 15 isentropic levels excluding 320 K, and on the PV = ± 2 PVU surface. Since forecast data are not available on isentropic levels or on the PV = ± 2 PVU surface, monthly means of forecast fields are produced only for surface and single level parameters and for parameters on model and pressure levels.

The monthly mean parameters on model and pressure levels are the same as those listed in Table 3 while for the isentropic and PV = ± 2 PVU surfaces they are listed in Tables 5 and 6. For the monthly averages of surface and single level parameters there are a few exceptions to the information given in Tables 7-9, as indicated in Table 14. There are no averages of the ‘‘Ocean-wave data’’ described in sub-section 2.5 or of the ‘‘Additional fields accumulated from the physical parametrizations’’ in sub-section 2.6.

Table 14: Monthly mean surface and single level parameters: Exceptions from Tables 7-9

| Parameter | An | Fc | Code | Units |
|--|---------|---------|------|--------------------------------|
| magnitude of surface stress (<i>accumulated</i>) | | X | 048 | N m ⁻² s |
| wind gusts at 10 m | no mean | no mean | 049 | |
| geopotential | X | no mean | 129 | m ² s ⁻² |
| land/sea mask | X | no mean | 172 | (0,1) |
| max. temp. at 2 m since previous post-processing | no mean | no mean | 201 | |
| min. temp. at 2 m since previous post-processing | no mean | no mean | 202 | |
| 10 metre wind speed | X | X | 207 | m s ⁻¹ |

3.1. Synoptic monthly means

The monthly averages produced for each of the 4 synoptic hours (00, 06, 12, and 18 UTC) are referred to as synoptic monthly means. These are identified in MARS by **stream=mnth**. The synoptic monthly means for analysed parameters are produced from the respective analyses at the appropriate synoptic hour for every day in the month. The synoptic monthly means for forecast parameters are produced from the appropriate 6- and 12-hour forecasts initiated at either 00 or 12 UTC. In addition, 3- and 9-hour forecasts are used to produce synoptic monthly means for surface and single level parameters.

Synoptic monthly means for instantaneous forecast parameters are computed from the set of all forecasts that have the relevant verifying time within the month. The first member of this set is the 12-hour forecast initiated at 12 UTC on the last day of the previous month, while the last member is the 6-hour (or 9-hour for surface and single level parameters) forecast initiated at 12 UTC on the last day of the month. Similarly, the means for accumulated forecast surface and single level parameters involve all relevant forecasts that have an accumulation period contained within the month. The first member used is therefore the 3-hour forecast initiated at 00 UTC on the first day of the month, while the last member is the 12-hour forecast initiated at 12 UTC on the last day of the month.

3.2. Monthly means of daily means

Monthly means of daily means are produced for analyses (the average of the four synoptic means) and instantaneous forecast data (the average of the four synoptic means at forecast steps of 6- and 12-hours from 00 and 12 UTC). In MARS they are identified by **stream=moda**. These averages represent means for the entire month.

3.3. Monthly means of daily forecast accumulations

Monthly means of daily forecast accumulations are produced for the relevant surface and single level fields (Tables 8 and 14) by averaging the twice daily forecasts (from 00 and 12 UTC) over the month for the forecast ranges of 0-12 hours, 12-24 hours and 24-36 hours. They are identified in MARS by **stream=mdfa**.

The monthly means of daily forecast accumulations include all relevant forecasts that have an accumulation period in the month and so represent accumulations for the entire month at the particular forecast range. All these means have been scaled to have units per day. Since the hydrological parameters are in units of m of water per day, they should be multiplied by 1000 to convert to $\text{kgm}^{-2}\text{day}^{-1}$ or to mmday^{-1} . Turbulent energy, radiation and momentum flux accumulations should be divided by 86400 seconds (24 hours) to convert to the commonly used units Wm^{-2} and Nm^{-2} , respectively.

4. Product access

The ERA-Interim Archive is part of ECMWF's Meteorological Archive and Retrieval System (MARS), which is accessible to registered users in ECMWF Member States and Co-operating States. MARS supports the supply of ERA-Interim data on a range of grids; see <http://www.ecmwf.int/services/archive> for full details.

Arrangements exist at a national level within some Members States to supply data to users within that state who do not have direct access to MARS.

Based on an agreement with ECMWF, the National Center for Atmospheric Research (NCAR) will maintain a copy of the complete contents of the ERA-Interim Archive to serve research and educational institutions in the USA; see <http://dss.ucar.edu/pub>.

A subset of the archived ERA-Interim data can be downloaded from the web for research and educational use. For conditions of use and access to these data please see the ECMWF Data Server at <http://data.ecmwf.int/data>. These data are available on a $1.5^{\circ}\times 1.5^{\circ}$ regular latitude-longitude grid, which corresponds to approximately half the resolution of the original fields.

Finally, ERA-Interim products are available for purchase from ECMWF Data Services subject to the rules of data distribution adopted by the Council of ECMWF. See <http://www.ecmwf.int/products/data> for details.

4.1. ECMWF Data Server

Fields from the ECMWF Data Server can be downloaded in either GRIB or NetCDF format and can be extracted on the globe or in a limited area. They include:

- all analysed surface parameters at 0, 6, 12 and 18 UTC;
- all forecast surface parameters at ranges of 3-, 6-, 9- and 12-hours from 00 and 12 UTC;
- all analysed upper-air parameters on 37 pressure levels at 00, 06, 12 and 18 UTC;

- all analysed parameters on 15 isentropic levels and $PV = \pm 2$ PVU at 00, 06, 12 and 18 UTC;
- monthly means of these parameters.

As implied by the above, the synoptic monthly means for forecast surface and single level parameters on the Data Server include all four forecast ranges. However, the monthly means of daily forecast accumulations for forecast surface and single level parameters only include the forecast step from 0-12 hours. Although spin up/down is present in ERA-Interim, it is not as large as in ERA-40, so this choice of forecast step is thought to be the best because it is the one most influenced by the assimilation of observations.

In addition to the above, the Data Server provides three analysed fields produced by the wave model.

4.2. MARS

Fields can be extracted from MARS in GRIB format, on the globe or in a limited area and at full or reduced resolution. Spectral fields can also be transformed to a grid. MARS users can either access the data from an ECMWF workstation or via the internet at <http://www.ecmwf.int/services/archive>, though the latter method does not have the full functionality of the former method. Full documentation for MARS can be found at <http://www.ecmwf.int/publications/manuals/mars>.

4.3. MARS retrieval examples

The following examples show how ERA-Interim data can be extracted from the MARS archive to an ECMWF workstation.

4.3.1. Example 1: instantaneous analysed surface pressure

```
Retrieve, Class=ei, Expver=1, Stream=oper, Type=an, Levtype=sfc, Param=sp,
Date=19890101, Time=00, Step=00, Target=myfile.grb
```

4.3.2. Example 2: synoptic monthly mean of analysed spectral geopotential at 500 hPa

```
Retrieve, Class=ei, Expver=1, Stream=mnth, Type=an, Levtype=pl, Level=500,
Param=z, Date=19890101, Time=06, Step=00, Target=myfile.grb
```

4.3.3. Example 3: monthly mean of daily mean of forecast 2m temperature

```
Retrieve, Class=ei, Expver=1, Stream=moda, Type=fc, Levtype=sfc, Param=2t,
Date=19890101, Time=00, Step=00, Target=myfile.grb
```

4.3.4. Example 4: monthly mean of daily forecast accumulation of total precipitation

```
Retrieve, Class=ei, Expver=1, Stream=mdfa, Type=fc, Levtype=sfc, Param=tp,
Date=19890101, Time=00, Step=12, Target=myfile.grb
```

4.3.5. Example 5: instantaneous analysed significant wave height

```
Retrieve, Class=ei, Expver=1, Stream=wave, Type=an, Levtype=sfc, Param=swh,
Date=19890101, Time=12, Step=00, Target=myfile.grb
```
