## BOTTGER, H.: THE MEMBER STATES EXPERIENCES WITH THE ECMWF EPS

### 3. Use of medium-range forecast guidance

All ECMWF Member States have developed their own procedures and concepts for the use of medium-range forecast products. The primary forecast guidance is the output from the deterministic T213L31 high resolution model. To an increasing extent forecasters are beginning to combine the results from the deterministic model and the EPS in an appropriate way.

Small signals of the EPS support for the solution offer by the T213 model and it will improve the overall performance of the forecast system. Forecasters have

found that the use of ensemble guidance is more reliable than the deterministic model. After all, the forecasters have seen that the ensemble has a low probability of errors that a well balanced ensemble can detect at an early stage with increasing probability.

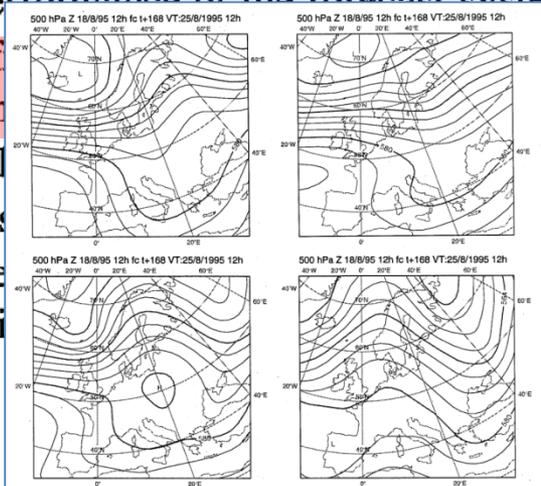

Fig. 2: 500 hPa height fields of 168 hours ensemble cluster mean forecasts valid 25 August 1995, cluster 1 (top left) has 8 members, cluster 2 (top right) 7 members, cluster 3 (bottom left) and cluster 4 each have 5 members, contour interval is 4 gdam.

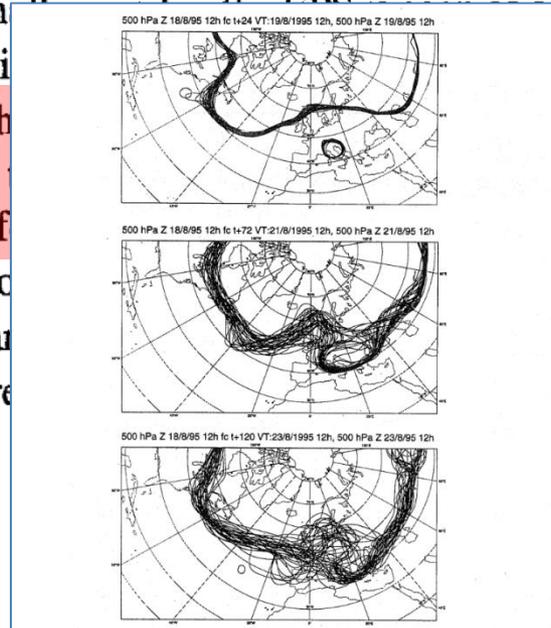

Fig. 3: Diagrams of 576 gpdam contour lines from all 33 members of the ensemble forecast of 18 August 1995 forecast ranges are 24 hours (top), 72 hours (centre) and 120 hours (bottom).

SMITH, L.A.: PREDICTABILITY PAST PREDICTABILITY PRESENT

## 2. Contrasting 1995 and 2002 Perspectives on Predictability

What has changed in the short time since the 1995 ECMWF Seminar on Predictability? Since I cannot avoid indirectly criticising what was happening in 1995, we will focus mostly on my contribution to the seminar.

A major focus of my 1995 paper was on ensemble formation for systems of chaotic differential equations, in contrast this talk does not contain a single differential equation. In fact, it contains only one equation and, as it turns out, that equation is ill-posed. The 1995 paper focuses on constructing perfect ensembles, while below we will be more concerned with interpreting operational ensembles. The 1995 paper quantifies the difference between some forecast probability density function (PDF) and a perfect PDF obtained by propagating current uncertainty forward in time under a perfect model, while below I am content to discuss how to change an ensemble of simulations into a PDF forecast in the first place. There is also a question as to how one should evaluate any forecast PDF, given that we never have access to the “perfect PDF”, if such a thing exists, but only observations of a single realization of weather. That is, we have only measurements of the one thing that happened, a target often called the *verification*. In general, it seems to me that the 1995 paper focuses on doing maths within the perfect model scenario (PMS), whereas the current paper is more interested in quantifying information content and debating resource allocation.

SMITH, L.A.: PREDICTABILITY PAST PREDICTABILITY PRESENT

## 2. Contrasting 1995 and 2002 Perspectives on Predictability

What has changed in the short time since the 1995 indirectly criticising what was happening in 1995,

### The Idea behind DEMETER

- Growing demand for reliable seasonal forecasts

### Summary

- DEMETER multi-model ensemble system fully installed
- Hindcast production follows closely ERA-40 production
  - 1987 – 1997 available, 1958 onwards started
- First assessment of skill
  - confirms potential of seasonal forecasting
  - demonstrates multi-model advantages
- Application of DEMETER data in end user models
  - demonstrates need for downscaling

Predictability Seminar

9-13 September 2002

resource allocation.

## The future...

- Monitor performance of different models to detect if skill of individual models change
- For applications needing local information, add value to forecasts by
  - Applying a suite of post-processing methods to the DMO
  - Working with users, i.e. move on from simple examples and ideal scenarios to "real life" applications and face the reality of forecasters and users
- Where should this work be done? Who should do this work?
  - Directly at the source of the forecasts or individually for/by users?

# 2017: where do we stand today?

# Potential vs. **actual** value

➔ Main goal of Division on Product Development and Customer Relations at DWD

➤ **Enhancing the importance and utility of weather information and (probabilistic) forecast products for the user by...**

- Collecting user requirements
- Consolidating requirements and possibilities
- Planning, coordinating and conducting new developments
- Supporting users to integrate weather information into their own decision support systems

➤ **Fostering the dialogue between users and developers in particular on integrating probabilistic information**

# Focus groups

# Ensemble of user requirements

**How to design forecast products,  
which fulfill all those requirements?**

# From theory to practice

## → Weather warnings: from EXtreme event Information to COMunication and action

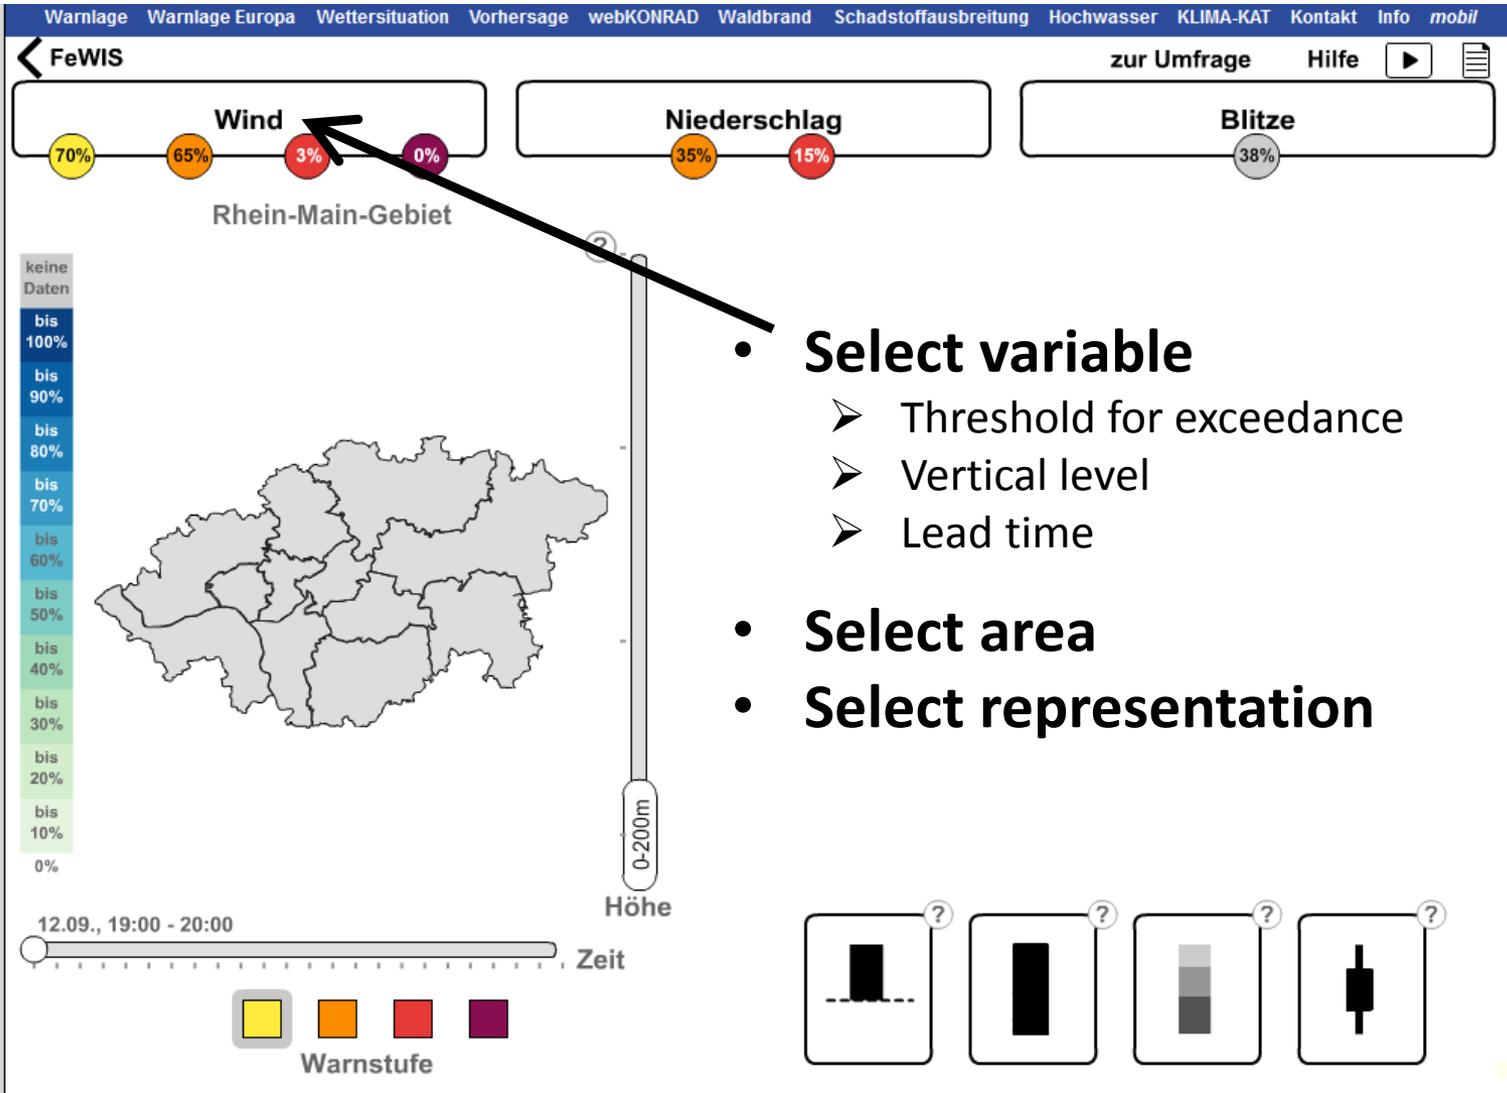

- Research project of the **Hans-Ertel-Zentrum** (funded by DWD)
- Inter- and **transdisciplinary approach** involving meteorology, social sciences, and psychology
- **Ultimate goal is to facilitate transparent and effective communication of risk and uncertainties to specific user groups**
- Using the DWD's fire brigade information system (FeWIS) as a testbed, the project will implement **different ways of communicating probabilistic weather information**
- Use of this **information will be analyzed in terms of usage and preferences** to determine whether and how risk-based warnings can help emergency managers to reduce the risk of loss and damage

- ➔ Quantify user preferences by analyzing web usage behavior
  - Which representations do users select?
  - How do users search? Where do they start? Where do they stop?
  - Do search patterns differ by user types or weather conditions?
  
- ➔ Repeated surveys after gaining experience with representations
  - How well do users understand the different probabilistic formats?
  - Include items on numeracy, graph literacy, trust
  - Questions about usability, usefulness, user preferences, likelihood of future use, suggestions and complaints

**A users statement:  
Without the new probabilistic trend forecasts,  
I wouldn't be able to organize the schedule for "on call duty" anymore!**

# The most recent challenge...

<https://opendata.dwd.de/>

- ➔ Everyone has access to the data, but not everyone has the same background on how best to use them
  - Examples of best practice have to be provided
  - Support of individual new ideas
- ➔ Motivate and enable (new / non-expert) user to take advantage of probabilistic information
  - Provide professional expertise and technical possibilities (APIs etc.)
- ➔ Enable private sector to develop new “smart services”

- Why was it so difficult to achieve this status?
  - Final decisions are always binary (or deterministic), conversion of probabilities to 0/1 was (and still is) not trivial .
  
- Today, ensemble products are integral part of many decision making processes. What was key to achieve this?
  - Establishing close contact and intensive dialogue between users and developers.
  
- My personal conclusion...
  - ...do continue improving the art of ensemble forecasting, but also keep in mind to what extent your sophisticated information is used (or not) by society and how much is “lost in translation”.
