

Workshop on developing Python frameworks for earth system sciences

Setting the scene

Baudouin Raoult

Software@ecmwf

- In support of operations
- In support of research
- In support of our users

Software@ecmwf

ecCodes/ODB, MARS, Magics, Metview,

MIR, ecFlow, Verify, ObsStat,

etc

A bit of history - MARS

```
retrieve,  
  type   = fc,  
  step   = 12/24/36/48,  
  date   = 2000-01-01,  
  time   = 12,  
  param  = z/t,  
  level  = 1000/500,  
  target = myfile.grib
```

1985

A bit of history – METVIEW (batch)

```
lincom,  
  type   = fc,  
  step   = 12/24,  
  date   = 2000-01-01,  
  time   = 12,  
  param  = z,  
  a      = -1,  
  b      = 1,  
  level  = 1000,  
  target = myfile.grib
```

$a * (\text{step } 24) - b * (\text{step } 12)$

1989

A bit of history – MARS compute

```
retrieve,  
  type   = fc,  
  step   = 12,  
  date   = 2000-01-01,  
  time   = 12,  
  param  = z,  
  level  = 1000  
  field  = a
```

```
retrieve,  
  step   = 24,  
  field  = b
```

```
compute,  
  formula = "b-a",  
  field   = c
```

```
write,  
  field   = c,  
  target  = myfile.grib
```

1993

A bit of history – MARS compute

Lazy loading of data: max 3 fields in memory at a time

50 fields, 39 MiB

100 fields, 78 MiB

```
retrieve,  
  type   = pf,  
  step   = 24,  
  number = 1/to/50,  
  date   = -1,  
  time   = 12,  
  param  = u,  
  stream = enfo  
  level  = 850  
  field  = u
```

```
retrieve,  
  param  = v,  
  field  = v
```

```
compute,  
  formula = "sqrt(u*u + v*v)",  
  field   = speed
```

```
compute,  
  formula = "mean(speed > 10)",  
  field   = proba,
```

1 field

```
write,  
  field   = proba,  
  target  = myfile.grib
```

1993

A bit of history – Metview macro

```
for step = 24 to 240 by 24

    u = retrieve(type: 'pf', step: step, number: [1,'to',50], date: -1,
                time: 12, param: 'u', stream: 'enfo', level: 850)

    v = retrieve(type: 'pf', step: step, number: [1,'to',50], date: -1,
                time: 12, param: 'v', stream: 'enfo', level: 850)

    speed = sqrt(u*u + v*v)
    proba = mean(speed > 10)

    style = contour(contour_line_colour: 'red')
    plot(proba, style)

end for
```

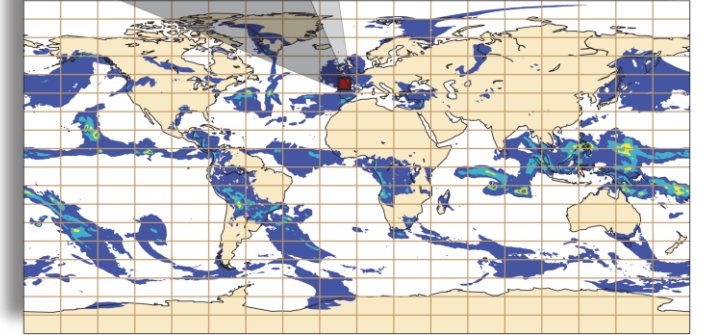

1994

TCL: 1988, Python2: 2000, Numpy: 2005

Metview

- Data access, manipulation and plotting
- Very high level abstraction (fieldset)
 - $a = b + c$
 - $a = \sin(b)$
 - A fieldset is a collection of fields
 - All operations are done grid-point wise

7.2	9.9	3.6	0.4	8.3	0.2	0.5	0.1	9.1	6.7
0.3	8.8	1.8	0.5	0.3	0.1	2.7	0.1	7.9	6.9
7.1	9.2	3.6	0.4	8.3	0.2	6.5	3.3	5.5	5.3
2.2	1.1	1.7	0.7	3.5	2.4	0.8	1.9	9.0	6.7

8.1	1.4	4.4	0.4	0.3	7.2	3.5	3.4	1.1	9.7
7.0	3.6	4.9	0.7	6.8	1.2	0.1	2.2	6.6	6.0
0.2	7.7	3.6	3.1	8.6	0.5	9.5	0.8	5.6	5.0
3.2	7.2	3.1	0.4	0.9	0.3	0.7	0.4	0.2	0.0

Metview

- Lazy
 - Can process millions of fields in one function

- $a = \sin(b + c * 2)$

Number of fields in memory: 3

1 million fields

1 million fields

1 million fields

1994

Metview

- Fully featured
 - numbers, strings, dates, list, dictionaries, ...
 - fields, observations, ...
 - *if, while, function, etc.*
 - extendable (Fortran, C++, bash...)

1994

Metview

- Service oriented
 - Most functions are (internal) services
 - Multi-process using 'futures'

1994

So why Python?

- Joining a community
 - Documentation
 - Stack overflow
- Open Source
 - Code reuse
- Ecosystem
 - Contributing our domain knowledge

From Metview to Python

- Leverage *numpy*, *scipy*, *pandas*, *matplotlib*, *xarray*, etc
- Keep the high abstraction of Metview
- Remain lazy
- Fit for operations
 - Maintainability, robustness,
 - 24/7 support, monitoring, troubleshooting
- Fit for users
 - Feature rich
 - Multiple data format

Best practices: Python in operations

- Versioning
- Testing
- Deployments

Best practices : Python from a user point of view

- Site installations
- Virtual environments
- IDEs
- Debugging

Best practices : Contributing

- Packaging
- Documentation
- Incoming/outgoing contributions
- Licensing/IPR

Working groups

- Deploying and packaging Python frameworks
- Handling Big Data in Python
- (Code) Interoperability and common data structures

Thank you!
