# Metview and Python - what they can do for each other

Workshop on Python for Earth System Sciences, ECMWF

Iain Russell, Fernando Ii, Sándor Kertész, Stephan Siemen

Development Section, ECMWF

© ECMWF November 28, 2017

#### What is Metview?

**ECFCMWF** 

- Workstation software for meteorological researchers and operational analysts; also for teaching (e.g. OpenIFS workshops)
- Handles GRIB, BUFR, NetCDF, ODB, Geopoints, CSV, ASCI
- Can access MARS, either locally or through the Web API

High-level interface, built on core ECMWF technologies: MARS, ecCodes, Magics, ODB, Emoslib (future: MIR)

- Interactive (icons) or batch usage (Macro language)
- UNIX, Open Source under Apache Licence 2.0
- Metview is a co-operation project with INPE (Brazil)

#### High-level data processing with Metview Macro

#### Why create a Python interface to Metview?

- Metview's Macro language is great; Python has even more language features
- Not everyone knows Metview Macro! Less learning curve for people who already know Python
- Enable Metview to work seamlessly within the Python eco-system
  - Bring Metview's data processing and interactive data inspection tools into Python sessions
  - Use existing solutions where possible (e.g. for multi-dimensional data arrays, data models)
- Should be able to interact with the Copernicus Climate Data Store Toolbox (in development)

pandas  $y_{it} = \beta' x_{it} + \mu_i + \epsilon_{it}$ 

### Current Status (1)

 Working prototype (developed with B-Open)

 Python code very similar to Macro!

• Still need

to finalise

packaging

and name

21		21		
<pre>22 plot (xs_europe, diff, pos)</pre>		22 mpy	. <b>plot</b> (xs_europe, absdiff, pos)	

### Current Status (1)

- Working prototype (developed with B-Open)
- Python code very similar to Macro!
- Still need to finalise packaging and name

#### Current status (2)

- Can run purely in batch (write data or plots into files), invoke Metview's interactive windows and can plot to Jupyter notebooks
- Requires "Python-ready" version of Metview to be installed, plus the Python package
  - Not widely installed at ECMWF yet
  - Metview 5.0 (beta to be released this December) will be the minimum version that can connect to Python
- Thin interface between Metview and Python
  - The Python layer should be fairly independent of the underlying Metview version

#### **Metview and Pandas**

Working prototype example

```
In [7]: import mpy.metview as mpy
        import numpy as np
        from scipy import stats
        t2m_grib = mpy.read('t2m.grib')
        obs_3day = mpy.read('obs_3day.bufr')
        t2m_gpt = mpy.obsfilter (
                                                    Metview
            parameter = '012004',
            output = 'geopoints',
            data = obs_3day)
        diff = t2m_grib - t2m_gpt
        df = diff.to_dataframe()
        outliers = np.abs(stats.zscore(df)) > 1.5
                                                    Scipy /
        print('Num outliers: ', outliers.sum())
                                                    numpy
        Num outliers: 7
```

#### Metview and xarray

Work in progress, but this is what we want

1 -	import mpy.metview as mpy	
2	import xarray as xr	
3 4 5	# use Metview to retrieve data from MARS # ensemble members for various vertical levels	]
6	ens = mpy. <b>retrieve</b> (	
7	type = "pf",	
8	stream = "ef",	Metview

#### Timeline

• Dec 2017: internal alpha release

- Installed at ECMWF, beta xarray GRIB driver, small gallery of examples and basic documentation
- March 2018: internal (ECMWF) beta release
  - Ready for further user testing, netCDF/GRIB harmonisation strategy
- June 2018: external beta release
  - Performance, feature completeness, test suite, documentation
- December 2018: production release
