2019 International Workshop on Radiative Transfer Models for Satellite Data Assimilation
04/30/19, Tianjin, China
Background

- Stokes vector (I,Q,U,V)
- Vector Radiative Transfer Equation:

$$\mu \frac{dI(\mu, \phi)}{d \tau} = I(\mu, \phi) - \frac{\omega}{4\pi} \int \int P(\mu, \mu', \phi - \phi') I(\mu', \phi') d\mu' d\phi'.$$

Introduction

- Radiative transfer equation (RTE) is extensively discussed by many textbooks (Chandrasekhar 1960; Preisendorfer 1965; van de Hulst 1980; Liou 2002; …)

- Methods:
  - Discrete-ordinate radiative transfer method, Adding-doubling method, Monte Carlo method, Successive order of scattering method, Matrix operator method, invariant imbedding method, …

- Computational time:
  - Numerically accurate simulation of RTE in a strongly forward-scattering medium requires high computational effort.

- Approximations:
  - Van de Hulst and Grossman (1968) scale the optical thickness by a factor (1-\(\omega_g\)) and replace the original phase function with an isotropic counterpart.
  - Coakley and Chylek (1975), Liou (1974), Meador and Weaver (1980) and Liou et al. (1988) use the two-stream or four-stream approximations.
  - Potter (1970) uses the delta-function to replace the forward peak.
  - Joseph et al. (1976) and Wiscombe (1977a) uses the delta-Eddington approximation.
  - Wiscombe (1977b) introduces the \(\delta\)-M approximation and Hu et al. (2000) introduces the \(\delta\)-Fit approximation.
Introduction

• The invariance of scaling of optical thickness and phase function is introduced by McKellar and Box (1981):

\[ P \approx 2f \delta (1 - \cos \Theta) + (1 - f) P_s, \]

\[ \tau_s = \tau (1 - \omega f), \quad \omega_s = \frac{1 - f}{1 - \omega f} \omega. \]
Introduction

• Small-angle approximation has been extensively used in multiple scattering of charged particles and radiative transfer (e.g. Scott 1963; Ishimaru 1978; Sobolev 1975...).

• Nakajima et al. (1983), Nakajima and Tanaka (1988), and Weinman et al. (1975) uses the summation of Gaussian functions to replace the forward peak and the small-angle approximation is realized by the successive order of scattering method and the Hankel transform technique.

• Semi-analytical small-angle approximation is introduced by Sobolev (1975), Dolin (1973), Remizovich et al. (1982), Zege et al. (1987)...

Method

Vector Radiative Transfer Equation (VRTM):

\[
\mu \frac{dI(\mu, \varphi)}{d\tau} = I(\mu, \varphi) - \frac{\omega}{4\pi} \int \int P(\mu, \mu', \varphi - \varphi') I(\mu, \varphi') d\mu' d\varphi'.
\]

\[I(\tau = 0, \mu, \mu_0, \varphi - \varphi_0) = \delta(\mu - \mu_0)\delta(\varphi - \varphi_0)(F_0 0 0)^T.
\]

Decomposition:

\[P(\mu, \mu', \varphi - \varphi) = fP_f(\mu, \mu', \varphi - \varphi) + (1-f)P_r(\mu, \mu', \varphi - \varphi),\]

\[I(\mu, \varphi) = I_f(\mu, \varphi) + I_r(\mu, \varphi) + I_e(\mu, \varphi).
\]

Three-Component VRTM:

Forward Equation:

\[
\mu \frac{dI_f(\mu, \varphi)}{d\tau} = I_f(\mu, \varphi) - \frac{\omega_f}{4\pi} \int \int P_f(\mu, \mu', \varphi - \varphi') I_f(\mu', \varphi') d\mu' d\varphi', \omega_f = \omega f;
\]

Regular Equation:

\[
\mu \frac{dI_r(\mu, \varphi)}{d\tau} = I_r(\mu, \varphi) - \frac{\omega_r}{4\pi} \int \int P_r(\mu, \mu', \varphi - \varphi') I_r(\mu', \varphi') d\mu' d\varphi' - \frac{\omega_r}{4\pi} \exp(-\frac{\tau_r}{\mu_0}) P_r(\mu, \mu_0, \varphi - \varphi_0) I_r(\mu_0, \varphi_0).
\]

\[\omega_r = \omega \frac{1-f}{1-\omega f}, \tau_r = (1-\omega f)\tau;
\]
Method

Error component:

\[
\mu \frac{dI_c(\mu, \varphi)}{d\tau} = I_e(\mu, \varphi)
\]

\[
-\frac{\omega}{4\pi} \int P(\mu, \mu', \varphi - \varphi') I_e(\mu', \varphi') d\mu' d\varphi' - J_1(\mu, \varphi) - J_2(\mu, \varphi),
\]

Forward Component:

\[
\mu \frac{dI_f(\mu, \varphi)}{d\tau} = I_f(\mu, \varphi) - \frac{\omega}{4\pi} \int \int P_f(\mu, \mu', \varphi - \varphi') I_f(\mu', \varphi') d\mu' d\varphi',
\]

\[
I_f \approx I_0^f + I_1^f + I_2^f
\]

\[
I_f \approx \frac{F}{2\pi V} e^{-\frac{\varphi^2}{2V}}
\]
